framework data (input values here: yellow fields)

| global CO2 budget 2020 - 2100 | Gt | determination |
|---|------|-----------------|
| land-use change (LUC) emissions 2020 - 2100 | 700 | |
| international shipping and aviation (ISA) emissions 2020 - 2100 | 0 | global budget |
| global CO2 budget 2020 - 2100 to distribute here | 3.3% | -23 |
| weighting population in the weighted key | 677 | national budget |
| potential for net negative emissions | 0% | overshoot |
| scenario type used for the reference values | -2% | RM-5-rad |
| | | paths |

Calculation global budget to distribute here:

LUC and ISA emissions are not considered here. Global LUC and ISA budgets are therefore offset against the global budget.

A value of zero for LUC means that by 2100, in total, net positive LUC emissions are offset by net negative LUC emissions.

Overshoot: The percentage stated is applied to the 2019 emissions and represents the minimum of the emissions pathway.

reference values for the countries with the highest emissions

| target year: | 2030 | 2035 | 2040 | emissions 2019 in Gt | per capita 2019 in t | share in global emissions 2019 | share in global population 2019 | year emissions neutralit | temporary overshoot in Gt | normalised start change rate 2025 |
|---------------|-----------------|------|------|----------------------------|----------------------------|---|--|--------------------------------|---------------------------------|---|

Basic idea behind the ESPM

The ESPM consists of two steps:

(1) **National budgets:** A predefined global CO2 budget is distributed to countries. The ESPM tool offers the use of a **weighted distribution key** that includes the '**population**' and the '**emissions**' in a base year (here: 2019).

(2) **National paths:** The ESPM tool offers the Regensburg Model Scenario Types to derive plausible national paths that adhere to a national budget.

Basic idea behind the scenario types RM 1 - 6

With the help of the RM Scenario Types, emission paths can be determined that meet a given budget. The scenario types differ in the **assumption** about the **property** of the **annual reductions**. This approach is particularly useful when it comes
