

more different framework data and corresponding results at: <http://results-espmsave-the-climate.info>

framework data (input values here: yellow fields)			determination
global CO2 budget 2020 - 2100	Gt	700	global budget
land-use change (LUC) emissions 2020 - 2100		0	
international shipping and aviation (ISA) emissions 2020 - 2100	3%	-21	
global CO2 budget 2020 - 2100 to distribute here		679	
weighting population key in the weighted key		85%	national budget
scenario type used for the reference values		RM-5-abs	paths

Calculation **global budget** to distribute here:
 LUC and ISA emissions are not considered here. Global LUC and ISA budgets are therefore offset against the global budget.
 A value of **zero** for LUC means that by 2100, in total, net positive LUC emissions are offset by net negative LUC emissions.

Basic idea behind the ESPM

The ESPM consists of two steps:

(1) **National budgets:** A predefined global CO2 budget is distributed to countries. The ESPM tool offers the use of a **weighted distribution key** that includes the **'population'** and the **'emissions'** in a base year (here: 2019).

(2) **National paths:** The ESPM tool offers the Regensburg Model Scenario Types to derive plausible national paths that adhere to a national budget.

Basic idea behind the Regensburg Model Scenario Types RM 1 - 6

With the help of the RM Scenario Types, emission paths can be determined that meet a given budget. The scenario types differ in the **assumption** about the **property** of the **annual reductions**. This approach is particularly useful when it comes to making **political decisions** about **emission paths**.
